

Summary on raptors and owls ringing in Slovakia in 2007 and 2008

Sumarizácia krúžkovania dravcov a sov v rokoch 2007 a 2008 na Slovensku

Vladimír SLOBODNÍK, Roman SLOBODNÍK & Miroslav DRAVECKÝ

Slobodník V, Slobodník R & Dravecký M 2009: Summary on raptors and owls ringing in Slovakia in 2007 and 2008. Slovak Rapt J 3: 63–72.

Abstract: This article provides brief information about the number, species and reports about ringed raptors and owls in Slovakia during the period 2007–2008. It is a continuation of similar results of the ringing of raptors and owls in the periods 2002–2004, 2005–2006. In 2007, from 1346 individuals of raptorial birds, 941 raptors and 405 owls of 24 species (16 species of raptors and 8 species of owls) including 805 raptors' and 218 owls' nestlings were ringed. In 2008, a total of 856 individuals were ringed, including 542 raptors and 314 owls of 25 species (15 species of raptors and 10 species of owls) including 421 raptors' and 113 owls' nestlings. Also in 2008, the number of ringed raptors and owls decreased by 36.4% in comparison to 2007.

Abstrakt: Článok poskytuje základnú informáciu o počte, druchoch a spätných hláseniach krúžkovaných druhov dravcov a sov na Slovensku za obdobie rokov 2007–2008. Správa kontinuálne navázuje na obdobne spracované výsledky krúžkovania dravcov a sov z obdobia 2002–2004, 2005–2006. V roku 2007 sa okrúžkovalo na Slovensku spolu 1346 ex., z toho 941 ex. dravcov a 405 ex. sov 24 druhov (16 druhov dravcov a 8 druhov sov), z toho mláďat v počte 805 ex., dravcov a 218 ex. sov. V roku 2008 sa okrúžkovalo spolu 856 ex. z toho 542 ex. dravcov a 314 ex. sov 25 druhov (15 druhov dravcov a 10 druhov sov), z toho mláďat v počte 421 ex. dravcov a 113 ex. sov. V roku 2008 poklesol počet okrúžkovaných dravcov a sov v porovnaní s rokom 2007 o 36,4 %.

Key words: raptors, owls, ringing, ring recoveries, Slovakia

Introduction

Bird ringing is one of the basic and traditional methods of biological monitoring of raptors and owls, especially for acquiring data on the migration of migratory raptors, their wintering grounds as well as the fidelity of the species and its attachment to the natal site (Meyburg et al. 2005, Danko & Maderič 2008), nesting environment, and also further knowledge about the movement of individual birds within the nesting area of the species. To acquire this kind of data a high number of individuals has to be ringed. However, the frequency of recovery reports remains rather low, and due to the low density of raptors and owls it is difficult to foresee an increase (Danko et al. 1996). Apart from traditional ringing, other methods are starting to be used e.g. colour rings (Dravecký et al. 2008a, Dravecký et al. 2008b), wing tags (Danko 1989b) or simultaneous combination of ringing and radio or satellite telemetry transmitter tagging (in Slovakia used e.g. in species *A. pomarina*, *A. heliaca* and *Falco cherrug*; Meyburg et al. 2004, Demeter et

al. 2006, 2007, Chavko et al. 2006, Uhrin et al. 2008, Prommer et al. 2009). Results and experiences from the ringing of raptors and owls in Slovakia have been published since 1975 (Danko 1977–1992, Danko et al. 1995a, b, Danko et al. 2000). Reports on bird ringing in Slovakia between 1989–1992 were presented by Formánek & Škopek (1989, 1992) and Kropil (1992). Since 1991, all results of raptor ringing were published in the collective reports on the ringing of birds in Slovakia (Kropil 1993, Korňan 1994a, b, 1995, Slobodník 2000, 2003–2006, 2008, Slobodník & Šnírer 2001, Slobodník & Sárossy 2007). The summary of ringed birds (including raptors and owls) and recovery reports were also published by individual bird ringers (Kaňuščák 1998, Kubán & Matoušek 1999, Hrdlovič 1999, Danko 2000, 2008, Šnírer et al. 2001, Sviečka 2004). Since 2002 individual reports on the ringing of raptors and owls in Slovakia have been published (Slobodník 2007, 2008), followed by this article on the evaluation of raptor and owl ringing in the period 2007–2008.

Summary of results

In 2007, 1 346 individuals of raptors and owls were ringed in Slovakia (4.4% of all ringed birds). The species spectrum of all ringed birds includes 156 species with raptors and owls comprising 15.4% of all species (24 species). A similar percentage of raptors and birds can be seen among the ringed nestlings. In 2007, 1 023 nestlings of raptors and owls were ringed, accounting for as

much as 30.7% of the total all birds ringed nestlings. In 2008, 856 individuals of raptors and owls were ringed, comprising 2.0% from all ringed birds in Slovakia. The species spectrum of all ringed birds comprises 165 species including 15.2% raptors and owls (25 species). Ringed raptor and owl nestlings (534) represented 13.8% from total ringed bird nestlings in Slovakia. In 2007, 24 species of raptors and owls were ringed (16 species of raptors

and 8 species of owls) with a total of 1 346 individuals (Tab. 1). This number includes 1 023 nestlings (76.0%). The five most abundant species of raptors and owls were presented by more than 90 individuals. This was the first recorded example of such a prevalence in the history of

our data collection. Five most frequently ringed species comprised 911 individuals or 67.7% of all raptors and owls ringed in 2007. The most dominant species included *Falco tinnunculus*, *Buteo buteo*, *Asio otus*, *Strix uralensis* and *Aquila pomarina*.

In 2007, the quantity of ringed raptors was noticeably higher than the number of ringed owls; 941 raptors and 405 owls were ringed, with owls comprising 30.1% of the evaluated species spectrum. The percentage of ringed nestlings is also higher within raptors in comparison to owls; 805 raptor nestlings (78.7%) and 218 owl nestlings (21.3%) were ringed. In 2008, 25 species of raptors and owls were ringed (including 15 raptor species and 10 owl species). 856 individuals were ringed (Tab. 1) of which 534 were nestlings, comprising 62.5% of all ringed raptors and owls. In 2008, the most frequently ringed species of

raptors and owls included: *Asio otus*, *Buteo buteo*, *Aquila pomarina*, *Asio flammeus* and *Falco peregrinus*.

The total numbers of ringed raptors and owls in 2008, as well as the total number of ringed nestlings, decreased to 63.6% of the 2007 level. The number of owls in the total was lower than in 2007, but formed a higher proportion. Raptors comprised 542 individuals (36.6%) and owls 314 individuals (33.6%) from the studied group. Raptor nestlings comprised 77.9% of all ringed raptors (421 individuals) and owl nestlings comprised 36.1% (113 individuals). In total 37 bird ringers have marked 1023 nestlings and

MUSEUM BRATISLAVA SLOVAKIA. Evidence led by SOS/BirdLife Slovakia / Slovenské ornitologické hliníkové krúžky : N. MUSEUM BRATISLAVA SLOVAKIA. Evidencia vedená SOS/BirdLife Slovensko

from Hungary, Czech Republic, Poland and Austria. The majority of recovery reports include swans and gulls based on the readings of colour rings or neck rings obtained using a monocular. In the period 2007–2008, 28 recovery reports of raptors and owls were collected, comprising only 3.1% of all recovery reports. To increase the number of recovery

reports of owls and raptors, a combination of traditional ringing with modern methods of raptor tagging is needed. The results of raptors and owls ringed in other countries and recorded in Slovakia are presented in Tab. 4. The data about the individual raptors and owls ringed in Slovakia and sighted abroad are presented in Tab. 5.
